

Free head lice removal in exchange for video footage

The Greater Vancouver Lice Clinic is searching for a subject to appear in a training video on how to remove head lice using the pesticide-free 'wet-combing' method at our clinic in Maple Ridge.

In our clinic we charge \$58 per hour for removal, but would like to offer this service free to someone who would allow us to film the process. It would take about two hours, which is double the average removal time, to allow for filming additional shots and takes. We can also provide a travel allowance of up to \$20.

We are looking for someone who has not been treated with a pesticide treatment or a combing treatment for at least 30 days, and the longer the hair, the better. The subject can be an adult or child, but it's important the subject is able to sit still for a long period. DVDs and a play tray with play-dough, Lego, and colouring sheets are provided to keep youngsters busy.

We have been using this method for 14 years and believe it is the safest and most effective method of eradicating an infestation of head lice. Please feel free to look at our website or call for more information.

Greater Vancouver Lice Clinic is British Columbia's first Head Lice Screening, Removal & Training Clinic. We are pleased to provide support to families, schools, and communities by offering current information and safe solutions to head lice eradication. We believe education is the best defense to beating these pesky critters. The Lice Clinic is eager to share all our head lice knowledge with you to ensure your success.

We provide a completely all-natural approach to head lice removal, focusing on manually removing lice and their nits using the Wet-Combing Method. This method is supported by health practitioners and pediatricians across Canada as the safest and most effective method to eliminate head lice.

The Lice Clinic advocates against the use of potentially harmful pesticides in treating head lice.

In fact, pesticide based products have little effect on the lice eggs (nits) which will eventually hatch resulting in **re-infestation**. *Manual Removal of all lice and nits is crucial to eradicating a head lice infestation.*
